```

```
The present invention relates to a hollow nanoparticle, which comprises a protein, e.g. hepatitis B virus surface antigen protein, with modified eystetaine residues. The nanoparticle specifically recognizes a target cell e.g. a liver cell. The nanoparticle is useful in methods for drug delivery. The present sequence is one such hepatitis B virus surface
                                                                                                                                 317
                                                                                                                                                                     539

                                                                                                                                                                                                                                                                                                                                      HBBAG L protein (P39) is an env protein. When L protein genes are introduced into animal cells (CHO cells) they produce HBBAG particles containing M and S proteins. The advantage is that peptides having HBBAG antigenicity are excreted outside the cells and easily purified. Claimed is a eukaryotic cell transformed with the rDNA. Pref. the cell is a yeast cell, sep. S. cerevisiae AH22R-/pGLD LB39-RCT, L11P39-RCT or LP31-RCT. Also claimed is recombinant DNA, which is a DNA coding for a signal peptide which functions in a eukaryotic cell, and is bound to the 5'-creminal of a DNA coding for a peptide having HBBAG activity. The signal peptide may be a signal peptide of egg white lysozme. When trypsin-like protease-producing yeast is utilized as the host, L protein and M protein can yossibly be degraded by the protease; therefore it is desirable that the genes are altered so that the 48th arginine residue from the N-terminal of M protein or a peptide containing the residue (preferably the (altered) coding for the amino acid sequence 1-383 shown in AAN80973.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        239

This invention relates to a novel hollow nanoparticle comprising a first protein capable of recognising specific cells and having particle forming ability, and a second protein which forms a capsid structure on the first protein. The first protein is preferably the hepatitis B virus surface antigen protein, which is capable of modifying the hepatocyte recognising site in the hepatitis B virus surface antigen protein of another biological recognition molecule, to beta cell phosphorus or a basic bibroblast growth factor (bFGF). The second protein is a hepatitis B virus inner core antigen protein. The invention is useful for treating a disease and for transferring a substance or drug specifically into a transfer of a substance or drug specifically into a transfer of a substance into a rarget cell or tissue, which can be produced in a stable yield. The present sequence is that of the Hepatitis B virus pre-SI protein gene sequence which is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    260

The protein that forms the particle is a hepatitis B virus (HBV) surface antigen protein. The gene is a blood coagulation factor VIII (IX) gene. Therapeutic agents of the invention are useful for treating haemophilia. They are efficiently transferred into liver cells with little risk of side effects. The present sequence represents a HBV surface antigen protein, which may be used to produce therapeutic agents of the invention.

The invention relates to a hollow nanoparticle (I) made of protein capable of forming particles and presents biological structure-
recognition sites on its surface, where the biological structure recognition sites are provided at both the N- and C-terminals of the recognition sites are provided at both the N- and C-terminals of the recognition sites are the following: production of (I); and sealed by (I): In (I), the biological structure recognition site with a substance and sealed by (I): In (I), the biological structure recognition site with a target. The biological structure recognition site is a target structure recognition site with recognition site is a target. The biological structure recognition site is a target. The biological structure recognition site is a target structure derived from virus e.g. hepatocyte recognition site of extructure derived from virus e.g. hepatocyte recognition site of the hepatitis B virus surface antigent protein, antigenic determinant e.g. the past structure tension site of the hepatitis B virus surface antigent protein, antigenic determinant and virus e.g. hepatocyte recognition site one or correct ag sequences are combined, or ligand e.g. cell growth factor or 22-tag. The cell growth factor is epidermal growth factor or 22-tag. The cell growth factor is epidermal growth factor or 22-tag. The cell growth factor is epidermal structure recognition site compines a tag capture and ligand protein which has particle formation ability is a surface antigen protein which has particle formation ability is a surface antigen protein. The biological structure recognition site is introduced into the cell is a compound comprising a gene compound of the proparation of the substance introduced into the cell is a compound comprising a gene compound of the proparation of the protein of the protein of the protein of the invention of the proparation of the protein of the invention of the proparation of the invention of the invention be purified efficiently and capable of forming particle and pe

Patent No. 6607127
GENERAL INFORMATION:
APPLICANT: Chisari, Francis V.
TITLE OF INVENTION: Peptides for Inducing Cytotoxic T
Lymphocyte Responses to Hepatitis B Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                 COMPUTER READABLE FORM:

Patent No. 6607727

GENERAL INFORMATION: Peptides for Inducing Cytotoxic T

TITLE OF INVENTION: Peptides for Inducing Cytotoxic T

Lymphocyte Responses to Hepatitis B Virus

NUMBER OF SEQUENCES: 99

CORRESPONDENCE ADDRESS:

ADDRESSEE: Townsend and Townsend and Crew LIP

STREET: Two Embarcadero Center, Eighth Floor

CITY: San Francisco

STATE: California
                                                                                                                                                                                                                                                                                                                  COUNTY: USA

ZIP: 94111-1834

COMPUTER READABLE PORM:
MEDIUM TYPE: Ploppy disk
COMPUTER: IBM PC COMPALIDLE
COMPUTER: IBM PC COMPALIDLE
SOFTWARE: Patentin Release #1.0, Version #1.25

CURRENT APPLICATION DATA:
RELING DATE: 20-May-1996
CLASSIFICATION: <Unknown>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         845

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         US-08-416-950-11

Sequence 11, Application US/08416950

Patent No. 5780036

Patent No. 5780036

Patent INFORMATION:

APPLICANT: CHISARI, Francis V.

TITLE OF INVENTION: PEPTIDES FOR INDUCING CYTOTOXIC T

TITLE OF INVENTION: LYMPHOCYTE RESPONSES TO HEPATITIS I

NUMBER OF SEQUENCES: 11

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             G 1620
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0 843
                                                                                                                                                                                                                                                                                              1200
                                                                                                                                                                                                                                                                                                                703
                                                                                                                                                                                                                                                                                                                                   1260
                                                                                                                                                                                                                                                                                                                                                    723
                                                                                                                                                                                                                                                                                                                                                                                                           1380
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1560
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1620

Patent No. 6607727
GENERAL INFORMATION:
APPLICANT: Chisari, Francis V.
TITLE OF INVENTION: Peptides for Inducing Cytotoxic T
Lymphocyte Responses to Hepatitis B Virus
NUMBER OF SEQUENCES: 99
CORRESPONDENCE ADDRESS:
ADDRESSE: Townsend and Townsend and Crew LLP
STREET: Two Embarcadero Center, Eighth Floor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      COUNTRY: USA

Patent No. 660727
GENERAL INFORMATION:
APPLICANT: Chieari, Francis V.
TITLE OF INVENTION: Peptides for Inducing Cytotoxic T
Lymphocyte Responses to Hepatitis B Virus
NUMBER OF SEQUENCES: 99
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    COUNTRY: USA

The present sequence is encoded by the genome of an isolated strain of antigen-'8'-130 on strain (Met to Thr). The viral genome is deposited as antigen-'8'-130 on strain (Met to Thr). The viral genome is deposited as ECCC accession numbers P97121501, P97121502 and P97121503. The nucleotide sequence was isolated from hepatocellular carcinoma (HCC). The nucleotide sequence encodes four overlapping proteins, which are a DNA polymerase, a large surface antigen, a core protein, and a transactivating X protein. The large surface antigen differs from the wild type sequence instead of a Met. The proteins are used to produce antibodies. The proteins, polymucleotide and antibodies can be used for detecting the novel HBV strain. The HBV polypeptides can also be used in hepatitis vaccines. The HBV novel strain polypeptides can be used to identify compounds for treating or preventing HBV infection or hepatocellular carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

```
The invention relates to a method of identifying a candidate peptide epitope which induces an HLA class I CTL response against variants of the peptide epitope, comprising identifying, from a particular antigen of an infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HBV polymerase protein used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of identifying a candidate peptide eptrope which induces an HLA class I CTL response against variants of the peptide eptrope, comprising identifying, from a particular antigen of an infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HBV polymerase protein used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                         Identifying a candidate peptide epitope, which induces a HLA class I CTL response comprises identifying variants of a peptide epitope 8-11 amino acids in length comprising primary anchor residues of the same HLA class I binding motif.

The invention relates to a method of identifying a candidate peptide epitope which induces an HLA class I CTL response against variants of the peptide epitope. Comprising identifying, from a particular antigen of an infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HBV polymerase protein used in the scope of the invention.

The invention relates to a method of identifying a candidate peptide epitope which induces an HLA class I CTL response against variants of the peptide epitope, comprising identifying, from a particular antigen of an infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HBV polymerase protein used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

The invention relates to a method of identifying a candidate peptide epitope which induces an HLA class I CTL response against variants of the peptide epitope, comprising identifying, from a particular antigen of an infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HBV polymerase protein used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TGGTGGCTCCAGTTCCCGGAACAGTAAACCCTGTTCCGACTACTGCCTCTCCCATATCGTC 120

The sequence was used to generate a series of peptides (AAR70044-59) which induce cytotoxic T cell (CTL) responses against cells infected with HBV. The HBpol peptides can be used, prophylactically as vaccines, together with, or conjugated to, epitopes from other HBV sequences that elicit T cell responses to HBV (see AAR70060-64). The peptides can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     are

The invention relates to a method of identifying a candidate peptide epitope which induces an HLA class I CTL response against variants of the peptide epitope, comprising identifying, from a particular antigen of an infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HBV polymerase protein used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TGGTGGCTCCAGTTCCGGAACAGTAAACCCTGTTCCGACTACTGCCTCTCCCATATCGTC 120

                                                                     ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel GRB94 protein. The GRB94 protein acts as a chaperone of DNA polymerase of hepatitis B virus. The invention further relates to: an expression vector system for preparing a DNA polymerase in the active state of a hepatitis B virus; a transformant and a manufacturing method of DNA polymerase of active hepatitis B virus using the transformant, and realized seases associated with hepatitis B virus. The manufacturing method of DNA polymerase of active hepatitis B virus. The manufacturing active of DNA polymerase of active hepatitis B virus. The manufacturing a host cell simultaneously with an expression expression comprises transforming a host cell simultaneously with an expression expression vector including a coding gene of GRP94 protein, culturing the transformed host under the condition to initiate replication at two of replication origins of the expression vectors, and purifying DNA polymerase of hepatitis B virus included in the culture solution. This sequence represents a Hepatitis B virus protein relating to the GRP94
                                                                                                                                                                                                                                                                                                                                                                    Grp94 acting as chaperone of DNA polymerase of hepatitis b virus and expression vector system for preparing a DNA polymerase in active state of hepatitis b virus.

infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HBV polymerase protein used in the scope of the invention.
                                                                                                                                                                                                                                                                                           240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    447
                                                                                                                                                                                                                  The invention relates to a method of identifying a candidate peptide epitope which induces an HLA class I CTL response against variants of the peptide epitope, comprising identifying, from a particular antigen of an infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HBV polymerase protein used in the scope of the invention.

The invention relates to a method of identifying a candidate peptide epitope which induces an HLA class I CTL response against variants of the peptide epitope, comprising identifying, from a particular antigen of an infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HBV polymerase protein used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       189

Press and surface antigen HBAG) and HBX proteins. HBV genotype G nucleic acids and polypeptides are useful for diagnosting, prognosting and treating infections caused by HBV genotype G. They can be used in a vaccine to treat or prevent HBV genotype G infection. The HBV genotype G derived nucleic acids and antibodies are useful for detecting HBV genotype G in a sample or diagnosis of HBV genotype G infection. The presence of HBV genotype G statistically correlates with the presence of Ilver damage and/or liver cancer in the subject. The HBV genotype G core innert peptide encoding nucleic acid is useful for designing monitoring assays or study and predict the evolution of anti-HBc and in-HBc antibodies and HBV genotype G are useful for identifying a antibodies or antigens of HBV genotype G are useful for identifying a
